Crown’s RDC-400U series underground road dust control agent is specifically designed to reduce road dust generation by binding together fine particles that give the road its integrity and strength. RDC-400U combines hydrophilic binding and plasticizing agents to dramatically improve road durability under established road maintenance practices, creating a hard, moisture-resistant, long-lasting surface. RDC-400U is the non-hazardous, non-toxic, non-corrosive, cost-effective alternative to other underground road dust products.

Crown’s technically trained field staff are ready to consult with our customers about how to best apply our products at the lowest possible cost to tackle your road dust control needs.

Underground fugitive road dust constitutes an environmental and safety concern for employees and contractors. Road dust reduces visibility, increases maintenance costs, and slows production.

Product Description and Use

- Provides long-lasting control of underground road dust emissions
- Creates durable wear course in dry underground environments
- Dramatically increases road strength, reducing potholes and other irregularities
- Reduces water usage by up to 95%

Treatment and Dosage Requirements

Proper treatment levels for RDC-400U will depend on road condition and maintenance as well as environmental and operating conditions. Crown Products & Services will provide a site-specific formula for achieving optimum results with our products.

Packaging Information

RDC-400U is available in tote and bulk for delivery to your location.

Safety Precautions

A Safety Data Sheet (SDS) is available upon request.
