**Product Description and Use**

Crown’s RDC-600P series road dust control agent is specifically designed to reduce road dust generation by binding together fine particles, giving the road its integrity and strength. RDC-600P dramatically improves durability under established road maintenance practices, creating a hard, long-lasting, moisture-resistant surface. RDC-600P is the non-hazardous, non-toxic, non-corrosive, cost-effective alternative to chloride-based treatments such as mag chloride. Roads treated with RDC-600P last longer and maintain superior wear course stabilization over mag.

Crown’s technically trained field staff are ready to consult with our customers about how to best apply our products at the lowest possible cost to tackle your road dust control needs.

Fugitive road dust constitutes an environmental and safety concern for employees and contractors. Road dust reduces visibility, increases maintenance costs, slows production, and creates a negative impact on the community.

**Treatment and Dosage Requirements**

Proper treatment levels for RDC-600P will depend on road condition and maintenance as well as environmental and operating conditions. Crown Products & Services will provide a site-specific formula for achieving optimum results with our products.

**Packaging Information**

RDC-600P is available in tote and bulk for delivery to your location.

**Safety Precautions**

A Safety Data Sheet (SDS) is available upon request.
